Apply filters to SQL queries

Project description

Omni Astrobiotics Inc. is working to make their system more secure. It is my job to ensure the system is safe, investigate all potential security issues, and update employee computers as needed. The following steps provide examples of how I used SQL with filters to perform security-related tasks.

Retrieve after hours failed login attempts

There was a potential security incident that occurred after business hours (after 18:00). All after hours login attempts that failed need to be investigated.

The following code demonstrates how I created a SQL query to filter for failed login attempts that occurred after business hours.

```
MariaDB [organization]> SELECT
    -> FROM log_in_attempts
    -> WHERE login_time > '18:00' AND success = FALSE;
 event_id | username | login_date | login_time | country | ip_address
                                                                            success
            apatel
                        2022-05-10 | 20:27:27
                                                I CAN
                                                           192.168.205.12
                                                                                    0
                       2022-05-11 | 19:28:50
        18
                                                  US
            pwashing
                                                            192.168.66.142
                        2022-05-12 | 18:56:36
                                                 MEXICO
                                                            192.168.109.50
```

The first part of the screenshot is my query, and the second part is a portion of the output. This query filters for failed login attempts that occurred after 18:00. First, I started by selecting all data from the $log_in_attempts$ table. Then, I used a WHERE clause with an AND operator to filter my results to output only login attempts that occurred after 18:00 and were unsuccessful. The first condition is $login_time > '18:00'$, which filters for the login attempts that occurred after 18:00. The second condition is success = FALSE, which filters for the failed login attempts.

Retrieve login attempts on specific dates

A suspicious event occurred on 2022-05-09. Any login activity that happened on 2022-05-09 or on the day before needs to be investigated.

The following code demonstrates how I created a SQL query to filter for login attempts that occurred on specific dates.

```
MariaDB [organization]> SELECT
   -> FROM log_in_attempts
    -> WHERE login_date = '2022-05-09' OR login_date = '2022-05-08';
 event id |
            username | login_date | login_time | country | ip_address
                                                                               success
        1 |
             jrafael
                        2022-05-09
                                                  CAN
                                                                                      0
                                     04:56:27
                                                            192.168.243.140
         3
             dkot
                        2022-05-09
                                     06:47:41
                                                  USA
                                                             192.168.151.162
                                                                                      0
             dkot
                        2022-05-08
                                     02:00:39
                                                   USA
                                                             192.168.178.71
```

The first part of the screenshot is my query, and the second part is a portion of the output. This query returns all login attempts that occurred on 2022-05-09 or 2022-05-08. First, I started by selecting all data from the $log_in_attempts$ table. Then, I used a WHERE clause with an OR operator to filter my results to output only login attempts that occurred on either 2022-05-09 or 2022-05-08. The first condition is $login_date = '2022-05-09'$, which filters for logins on 2022-05-09. The second condition is $login_date = '2022-05-08'$, which filters for logins on 2022-05-08.

Retrieve login attempts outside of Mexico

After investigating the organization's data on login attempts, I believe there is an issue with the login attempts that occurred outside of Mexico. These login attempts should be investigated.

The following code demonstrates how I created a SQL query to filter for login attempts that occurred outside of Mexico.

```
MariaDB [organization]> SELECT
    -> FROM log_in_attempts
    -> WHERE NOT country LIKE 'MEX%';
 event_id |
            username
                        login_date | login_time |
                                                   country | ip_address
                                                                                success
                                                                                       0
                        2022-05-09
                                      04:56:27
                                                   CAN
                                                             192.168.243.140
                                                   CAN
             apatel
                        2022-05-10
                                      20:27:27
                                                              192.168.205.12
                                                                                       0
             dkot
                        2022-05-09
                                                   USA
                                                              192.168.151.162
```

The first part of the screenshot is my query, and the second part is a portion of the output. This query returns all login attempts that occurred in countries other than Mexico. First, I started by selecting all data from the <code>log_in_attempts</code> table. Then, I used a <code>WHERE</code> clause with <code>NOT</code> to filter for countries other than Mexico. I used <code>LIKE</code> with <code>MEX%</code> as the pattern to match because the dataset represents Mexico as <code>MEX</code> and <code>MEXICO</code>. The percentage sign (%) represents any number of unspecified characters when used with <code>LIKE</code>.

Retrieve employees in Marketing

My team wants to update the computers for certain employees in the Marketing department. To do this, I have to get information on which employee machines to update.

The following code demonstrates how I created a SQL query to filter for employee machines from employees in the Marketing department in the East building.

```
MariaDB [organization]> SELECT *
    -> FROM employees
    -> WHERE department = 'Marketing' AND office LIKE
  emplovee id
                               username
         1000
                a320b137c219 | elarson
                                           Marketing
                                                        East-170
                             | jdarosa
                a192b174c940
                                           Marketing
                                                        East-195
                                           Marketing
                x573y883z772
                               fbautist
```

The first part of the screenshot is my query, and the second part is a portion of the output. This query returns all employees in the Marketing department in the East building. First, I started by selecting all data from the <code>employees</code> table. Then, I used a <code>WHERE</code> clause with <code>AND</code> to filter for employees who work in the Marketing department and in the East building. I used <code>LIKE</code> with <code>East%</code> as the pattern to match because the data in the <code>office</code> column represents the East building with the specific office number. The first condition is the <code>department = 'Marketing'</code> portion, which filters for employees in the Marketing department. The second condition is the <code>office LIKE 'East%'</code> portion, which filters for employees in the East building.

Retrieve employees in Finance or Sales

The machines for employees in the Finance and Sales departments also need to be updated. Since a different security update is needed, I have to get information on employees only from these two departments.

The following code demonstrates how I created a SQL query to filter for employee machines from employees in the Finance or Sales departments.

```
MariaDB [organization]> SELECT
    -> FROM employees
    -> WHERE department = 'Finance' OR department = 'Sales';
  employee_id
                device id
                d394e816f943
                                sgilmore
         1003
                                           Finance
                                                         South-153
                h174i497j413
         1007
                                wjaffrey
                                           Finance
                                                         North-406
         1008
                i858j583k571
                                abernard
                                           Finance
                                                         South-170
```

The first part of the screenshot is my query, and the second part is a portion of the output. This query returns all employees in the Finance and Sales departments. First, I started by selecting all data from the <code>employees</code> table. Then, I used a <code>WHERE</code> clause with <code>OR</code> to filter for employees who are in the Finance and Sales departments. I used the <code>OR</code> operator instead of <code>AND</code> because I want all employees who are in either department. The first condition is <code>department = 'Finance'</code>, which filters for employees from the Finance department. The second condition is <code>department = 'Sales'</code>, which filters for employees from the Sales department.

Retrieve all employees not in IT

My team needs to make one more security update on employees who are not in the Information Technology department. To make the update, I first have to get information on these employees.

The following demonstrates how I created a SQL query to filter for employee machines from employees not in the Information Technology department.

```
MariaDB [organization]> SELECT *
-> FROM employees
-> WHERE NOT department = 'Information Technology';
+-----+
| employee_id | device_id | username | department | office |
+----+
| 1000 | a320b137c219 | elarson | Marketing | East-170 |
| 1001 | b239c825d303 | bmoreno | Marketing | Central-276 |
| 1002 | c116d593e558 | tshah | Human Resources | North-434 |
```

The first part of the screenshot is my query, and the second part is a portion of the output. The query returns all employees not in the Information Technology department. First, I started by selecting all data from the <code>employees</code> table. Then, I used a <code>WHERE</code> clause with <code>NOT</code> to filter for employees not in this department.

Summary

I applied filters to SQL queries to get specific information on login attempts and employee machines. I used two different tables, $log_in_attempts$ and employees. I used the AND, OR, and NOT operators to filter for the specific information needed for each task. I also used LIKE and the percentage sign (%) wildcard to filter for patterns.
